ChatGPT said:

I checked your uploaded `index.html` for the **MediCare AI** mini project. It already has the HTML structure for Dashboard, Patients, Prescriptions, Reminders, and AI Assistant. It also references an external `app.js` file, where the JavaScript functionality should go.

I'll help you implement JavaScript for features such as:

- Live digital clock
- Dashboard navigation
- Add, edit, and delete patient records
- Prescription management
- Medicine reminders
- AI Assistant interface
- Saving records in browser storage

Your current HTML also references `/styles.css`, so the JavaScript needs to work with the existing page structure.

MediCare AI — JavaScript

app.js · JavaScript syntax checked

Ready

Download app.js ↗

How to use it

1. Download the JavaScript file.
2. Put `app.js` in the same folder as your `index.html`.
3. Keep this line at the bottom of your HTML:

```HTML
<script src="/app.js"></script>
```

4. If you're opening the project directly from your computer, change it to:

```HTML
<script src="./app.js"></script>
```

5. Run the website through your development server and test each menu.

Important: Patient, prescription, and reminder records are saved in browser storage. The JavaScript does not yet send real SMS messages or connect to a live AI model. Browser storage is suitable for a demo, not for securing real patient information.
